

Name: _____ Form: _____ Teacher: _____

Fourth Form Physics

2014 (February)

Instructions to candidates:

Answer ALL questions in the spaces provided.

You will need the following: pen, pencil, ruler, and calculator.

The numbers in square brackets show the marks available per question. Use this as a guide to show how long to spend on each part (about one minute per mark).

Show all your working, including formulae when answering numerical questions.

Time allowed: 35 minutes

IMPORTANT: DO NOT talk about the exam outside lessons as it will be sat by other 4th form classes at different times.

1 (8)	
2 (17)	
3 (11)	
Total (36)	

Assume g (Earth) = 10 N/kg g (Mars) = 3.7 N/kg

Blank Page

Question 1.

On a clear night if you look across a lake at a full moon. Draw a diagram of the reflection of the moon in the lake:

- i. When the lake is **flat calm**

- ii. When there is a breeze causing **waves and ripples** on the surface.

One type of telescope used to look at other planets in the Solar system is called a 'reflecting telescope.'

a) State the two laws of reflection:

- a.
-
- b.
-

[2]

b) Complete the path of the two light rays shown to show how light from distant objects may be focused into the eyepiece lens for the viewer to see by reflections from two mirrors. You should include the normals where appropriate.

[3]

c) Comment on the appearance any object viewed through the telescope, will it be inverted, and if so in which directions?

.....

.....

.....

.....

[1]

Question 2.

The Alma telescope is part of an array of telescopes in the Atakama desert, Chile. Many of the dishes can be moved into different positions to maximise the quality of data.

The trucks that move the telescopes have 28 wheels and weigh 1.2×10^6 N.

- a) If each wheel has an area of 1.0 m^2 in contact with the ground, calculate the total pressure exerted on the desert floor by the vehicle. Give your answer to a suitable number of significant figures.

.....

.....

.....

.....

.....

.....

.....

.....

.....

Answer: _____ N/m^2

b) Each wheel is supported by an incredibly stiff suspension spring. State Hooke's Law and explain using the idea of the spring constant what the difference is between a stiff and soft spring.

.....

.....

.....

.....

.....

.....

[2]

c) Sketch a graph of force against extension for a metal spring. Label the axes and annotate the key features of the graph. You should assume the spring obeys Hooke's law *until* an extension of 30 cm is reached (when a force of 15 N is applied.)

[3]

d) You have an unlimited supply of 3cm springs which have a spring constant 0.4 N/cm. Starting from 2m above the ground, what is the maximum number you can join in series (i.e. one under another), hang a 200g mass hanger of length 10cm on the bottom, and not have the hanger touch the ground?

i) Calculate the force acting on each spring

.....
.....
.....
..... [2]

ii) Calculate the extension of each spring (you should neglect the weight of the springs themselves)

.....
.....
..... [2]

iii) Find the maximum length of all the extended springs (i.e. between the top of the hook and 2m above the ground).

.....
..... [1]

iv) Write down an expression for the maximum number of springs (including both length AND extension) that fit within this length.

.....
.....
.....
.....
.....
.....
.....
..... [3]

Question 3.

While exploring on Mars an astronaut stumbles into a cave containing a pool of glowing liquid and three coloured cubes. She decides to investigate the pool using the cubes and her oxygen tank as a measuring tool. She finds the following results:

- i) The three cubes together are as heavy as the tank
- ii) The length of two red cubes plus a green cube is the same as the tank
- iii) The length of two green cubes plus a blue cube is twice as long as the tank
- v) All of the cubes float in the glowing liquid with half of their volumes exposed.

On returning to base she measures that the tank is 35 cm long and has a mass of 20 kg.

a) Fill in the missing data from the table:

Colour of cube	Length of cube (cm)
Red	7.8
green	
Blue	

[2]

(you may use this space for working)

a) Calculate the **weight** of all three of the cubes taken together.

.....

.....

.....

.....

.....

.....

[3]

b) Calculate the **total volume** of displaced liquid in the glowing pool when all of the cubes are put into it.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

[3]

d) Archimedes' principle states: "for a floating body, the weight of displaced liquid is equal to the weight of the floating object".

Hence find the density of the glowing liquid in g/cm^3

.....
